## Top Tips To Improve Your Indoor Air Quality From Your Heating & Cooling Comfort Pros At WK Mechanical

Poor indoor air quality can happen for many reasons. While you could be facing contamination from chemicals or construction materials, most of the time, poor air quality is the result of everyday things inside your home. Your comfort is our biggest priority so we thought we would offer some thoughts on things you can do to improve your indoor air quality!

- 1. Change Your Air Filters** - A clean filter reflects the air you are breathing. If you rarely change your air filter, it is no longer able to perform the function of cleaning your air effectively. Think about it, even when the filter is full, air is still being pushed through. Dirty particles are going to circulate throughout your home. We recommend changing your air filters every 90 days.
- 2. Add UV Lights To Improve Indoor Air Quality** - Ultraviolet or UV Lights have been used for decades in commercial spaces to help disinfect the water and air. Today UV technology is often used to improve the indoor air quality in homes. Installing a UV light is one way to ensure that the air you and your family and friends breathe is as healthy as possible.
- 3. Whole Home Air Purification Systems** - A whole-house purification system can make sure your family is breathing cleaner, healthier air. It can also help to attack odors, and remove fine particles like pollen, dust and pet dander.
- 4. Whole Home Dehumidifiers** - Excess moisture and humidity can make air feel uncomfortable and promote the breeding of mold and mildew. Adding a

whole home dehumidifier helps to control moisture and reduce allergens. If you suspect an issue with the quality of air in your home, we can help! [Head to our website](#) for more information!

## To Upgrade Or Not To Upgrade?

### *Top 5 questions to ask when considering an upgrade to your Central Air Conditioner.*

As the weather starts to warm, you may find yourself considering if it is time to upgrade your Central Air Conditioner. Is it time to bite the bullet and invest in a whole new system, or with a little TLC, can you make do with your current system?

We've compiled a list of 5 questions designed to help make the decision easier:

- 1. How old is your current system?** If your answer is less than 10 years, making repairs may be the way to go. Older systems (those more than 10 years old) may run on out-of-date refrigerants that are harmful to the environment.
- 2. How Often Are You Calling For Repairs?** If you have called for repairs more than 2 times in the last 10 years, consider having it replaced. A good rule of thumb is that if the repair needed equals a cost that is more than 25% of the cost for a brand-new system, an upgrade may be a smart move.
- 3. Are Your Monthly Utility Bills Continually Increasing?** If you have seen an increase of more than 10%, upgrading your system may be

worth it in the long run. Newer Air Conditioning systems are more energy efficient.

4. **Does Your AC Adequately Cool Your Home?** If you find that some rooms do not get as cool as others, your current system may not be sized properly for your home and an upgrade may be a good idea to keep your entire family comfortable!
5. **Is Saving Energy Important To You?** Newer Air Conditioning systems are more energy efficient. Not only are they better for the environment, but they can also provide significant savings on your monthly utility bills. If saving energy is a priority for you, then it may be time to have a conversation about upgrading your Central Air Conditioning system.

If you have taken the time to answer all the questions above and still aren't sure what the best option for you is, we encourage you to give us a call! We offer free in-home comfort consultations that provide you with an honest assessment of your home. Together we can help you come up with a solution that will keep you and your family in comfort all summer long! [Find out more on our website.](#)
